

Ideation phase -I

2. Define the Problem Statement

2.1 Primary Problem Statement

End Users and L1 Support Agents need an intelligent, automated system to classify and route IT tickets instantly because manual triage is slow, error-prone, and causes 35-40% tickets to be misrouted, leading to SLA breaches and poor user satisfaction.

2.2 5W1H Analysis

WHO is facing the problem? L1 Support Agents, IT Managers, and End Users (Employees) WHAT is the problem? Every ticket has to be read manually to decide Category, Priority, and which team should work on it. WHEN does it occur? At the moment of ticket creation, especially during high volume (Monday mornings, after releases). WHERE does it occur? In ITSM tools like ServiceNow, Jira, Freshservice. WHY is it a problem? Takes 5-10 mins per ticket, wrong assignment increases resolution time by 2x, affects SLA, high cost. HOW big is the problem? In an org with 1000 tickets/day, 300-400 tickets are misrouted daily.

2.3 Current vs Future State

2.4 Constraints & Success Metrics

Constraints: Must be built inside Flow Designer (no-code/low-code preferred), must work in real-time, must maintain data privacy Success Metrics: 85%+ accuracy, <5 sec routing, 70% effort reduction, MTTR reduced by 40%

Date	28.09.2026
Team ID	SWTID-2026-6482
Project Name	Auto Ticket Classification using Flow Designer

Current State (Manual)	Future State (With Auto Classification)
Agent reads each ticket manually	Flow Designer triggers automatically on creation
5-10 min per ticket for routing	<5 sec auto-classification via ML API
35-40% misrouting	<10% misrouting with confidence check
SLA breach 18%	SLA improvement, MTTR reduced by 50%
