

Requirement Analysis phase-II
2 Solution Requirements - Functional & Non-Functional

2.1 Functional Requirements

2.2 Non-Functional Requirements

Date	28.09.2026
Team ID	SWTID-2026-6482
Project Name	Auto Ticket Classification using Flow Designer

Req ID	Requirement	Description
FR-01	Ticket Creation Trigger	Flow Designer must trigger automatically when incident is created in incident table
FR-02	Text Preprocessing	System must clean short_description + description (lowercase, stopword removal, lemmatization)
FR-03	Category Classification	ML model must predict Category (Hardware, Software, Network, Access, Email, Server) with >85% accuracy
FR-04	Assignment Group Prediction	System must predict correct assignment group (e.g., Hardware Support, Network Team)
FR-05	Priority Prediction	System must predict Priority P1-P4 based on impact/urgency keywords
FR-06	Auto-Update Record	Flow must update incident record with predicted values via Update Record action
FR-07	Confidence-based Routing	If confidence <60%, route to Manual Triage group, else auto-assign
FR-08	Notification	Send email/notification to assignee and end user after auto-assignment
FR-09	Feedback & Retraining	Allow agent to correct classification, store correction for model retraining
FR-10	KB Suggestion	Suggest relevant KB articles based on predicted category

Req ID	Requirement	Description
NFR-01	Performance	Classification must complete in <5 seconds per ticket
NFR-02	Accuracy	Overall accuracy >=85% for Category, >=80% for Priority
NFR-03	Scalability	System must handle 1000+ tickets per day without delay
NFR-04	Availability	Flow + ML API must have 99.5% uptime
NFR-05	Security	Historical ticket data must be anonymized, API secured via OAuth
NFR-06	Usability	No-code Flow Designer approach, easy to maintain by admin
NFR-07	Maintainability	Model retraining pipeline every month with feedback data
NFR-08	Compatibility	Must work with ServiceNow PDI, no extra license for Predictive Intelligence if using Python alternative
